

Application Architecture

The `apply-doc-standards` tool is a command-line application built with PHP. It is designed to be a standalone executable that can be run from the command line.

High-Level Architecture

The application is composed of three main layers:

1. **Core Layer:** This layer is responsible for the main application logic, including command-line argument parsing, configuration management, and orchestrating the documentation standards application process.
2. **Utils Layer:** This layer provides utility classes for file scanning, documentation processing, and configuration management.
3. **Vendor Layer:** This layer contains the third-party dependencies managed by Composer.

Directory Structure

- `apply-doc-standards`: The main executable file.
- `src/`: Contains the source code of the application.
 - `Core/`: Contains the core application logic.
 - * `Application.php`: The main application class.
 - `Utils/`: Contains the utility classes.
 - * `ConfigManager.php`: Manages the configuration of the application.
 - * `DocumentationProcessor.php`: Processes the documentation files.
 - * `FileScanner.php`: Scans for files to be processed.
- `docs/`: Contains the documentation of the application.
- `tests/`: Contains the tests of the application.
- `vendor/`: Contains the third-party dependencies.
