

Changelog

All notable changes to phar-io/version are documented in this file using the Keep a CHANGELOG principles.

[3.2.1] - 2022-02-21

Fixed

- Have `ExactVersionConstraint` honor build metadata (added in 3.2.0)

[3.2.0] - 2022-02-21

Added

- Build metadata is now supported and considered for equality checks only

[3.1.1] - 2022-02-07

Fixed

- #28: `VersionConstraintParser` does not support logical OR represented by single pipe (`|`) (Thanks @llaville)

3.1.0 - 2021-02-23

Changed

- Internal Refactoring
- More scalar types

Added

- #24: `Version::getOriginalString()` added (Thanks @addshore)
- Version constraints using the caret operator (`^`) now honor pre-1.0 releases, e.g. `^0.3` translates to `0.3.*`)
- Various integration tests for version constraint processing

Fixed

- #23: Tilde operator without patch level

3.0.4 - 14.12.2020

Fixed

- #22: make dev suffix rank works for uppercase too

3.0.3 - 30.11.2020

Added

- Comparator method `Version::equals()` added

3.0.2 - 27.06.2020

This release now supports PHP 7.2+ and PHP ^8.0. No other changes included.

3.0.1 - 09.05.2020

Potential BC Break Notice: `Version::getVersionString()` no longer returns v prefixes in case the “input” string contained one. These are not part of the semver specs (see <https://semver.org/#is-v123-a-semantic-version>) and get stripped out. As of Version 3.1.0 `Version::getOriginalString()` can be used to still retrieve it as given.

Changed

- Internal Refactoring
- More scalar types

Fixed

- Fixed Constraint processing Regression for ^1.2 and ~1.2

3.0.0 - 05.05.2020

Changed

- Require PHP 7.2+
- All code now uses strict mode
- Scalar types have been added as needed

Added

- The technically invalid format using ‘v’ prefix (“v1.2.3”) is now properly supported

2.0.1 - 08.07.2018

Fixed

- Versions without a pre-release suffix are now always considered greater than versions with a pre-release suffix. Example: `3.0.0 > 3.0.0-alpha.1`

2.0.0 - 23.06.2018

Changes to public API:

- `PreReleaseSuffix::construct()`: optional parameter `$number` removed
- `PreReleaseSuffix::isGreaterThan()`: introduced
- `Version::hasPreReleaseSuffix()`: introduced

Added

- #11: Added support for pre-release version suffixes. Supported values are:
 - `dev`
 - `beta` (also abbreviated form `b`)
 - `rc`
 - `alpha` (also abbreviated form `a`)
 - `patch` (also abbreviated form `p`)

All values can be followed by a number, e.g. `beta3`.

When comparing versions, the pre-release suffix is taken into account.

Example: `1.5.0 > 1.5.0-beta1 > 1.5.0-alpha3 > 1.5.0-alpha2 > 1.5.0-dev11`

Changed

- reorganized the source directories

Fixed

- #10: Version numbers containing a numeric suffix as seen in Debian packages are now supported.
