

Changelog

UNRELEASED

1.11.0

Added

- Added explicit (non magic) `allNullOr*` methods, with `@psalm-assert` annotations, for better Psalm support.

Changed

- Trait methods will now check the assertion themselves, instead of using `__callStatic`
- `isList` will now deal correctly with (modified) lists that contain `NaN`
- `reportInvalidArgument` now has a return type of `never`.

Removed

- Removed `symfony/polyfill-ctype` as a dependency, and require `ext-ctype` instead.
 - You can still require the `symfony/polyfill-ctype` in your project if you need it, as it provides `ext-ctype`

1.10.0

Added

- On invalid assertion, we throw a `Webmozart\Assert\InvalidArgumentException`
- Added `Assert::positiveInteger()`

Changed

- Using a trait with real implementations of `all*()` and `NullOr*()` methods to improve psalm compatibility.

Removed

- Support for PHP <7.2

1.9.1

Fixed

- provisional support for PHP 8.0

1.9.0

- added better Psalm support for `all*` & `nullOr*` methods
- These methods are now understood by Psalm through a mixin. You may need a newer version of Psalm in order to use this
- added `@psalm-pure` annotation to `Assert::notFalse()`
- added more `@psalm-assert` annotations where appropriate

Changed

- the `all*` & `nullOr*` methods are now declared on an interface, instead of `@method` annotations. This interface is linked to the `Assert` class with a `@mixin` annotation. Most IDE's have supported this for a long time, and you should not lose any autocompletion capabilities. PHPStan has supported this since version 0.12.20. This package is marked incompatible (with a composer conflict) with phpstan version prior to that. If you do not use PHPStan than this does not matter.

1.8.0

Added

- added `Assert::notStartsWith()`
- added `Assert::notEndsWith()`
- added `Assert::inArray()`
- added `@psalm-pure` annotations to pure assertions

Fixed

- Exception messages of comparisons between `DateTime(Immutable)` objects now display their date & time.
- Custom Exception messages for `Assert::count()` now use the values to render the exception message.

1.7.0 (2020-02-14)

Added

- added `Assert::notFalse()`
- added `Assert::isAOf()`
- added `Assert::isAnyOf()`
- added `Assert::isNotA()`

1.6.0 (2019-11-24)

Added

- added `Assert::validArrayKey()`

- added `Assert::isNonEmptyList()`
- added `Assert::isNonEmptyMap()`
- added `@throws InvalidArgumentException` annotations to all methods that throw.
- added `@psalm-assert` for the list type to the `isList` assertion.

Fixed

- `ResourceBundle` & `SimpleXMLElement` now pass the `isCountable` assertions. They are countable, without implementing the `Countable` interface.
- The doc block of `range` now has the proper variables.
- An empty array will now pass `isList` and `isMap`. As it is a valid form of both. If a non-empty variant is needed, use `isNonEmptyList` or `isNonEmptyMap`.

Changed

- Removed some `@psalm-assert` annotations, that were ‘side effect’ assertions See:
 - #144
 - #145
 - #146
 - #150
- If you use Psalm, the minimum version needed is 3.6.0. Which is enforced through a composer conflict. If you don’t use Psalm, then this has no impact.

1.5.0 (2019-08-24)

Added

- added `Assert::uniqueValues()`
- added `Assert::unicodeLetters()`
- added: `Assert::email()`
- added support for Psalm, by adding `@psalm-assert` annotations where appropriate.

Fixed

- `Assert::endsWith()` would not give the correct result when dealing with a multibyte suffix.
- `Assert::length()`, `minLength`, `maxLength`, `lengthBetween` would not give the correct result when dealing with multibyte characters.

NOTE: These 2 changes may break your assertions if you relied on the fact that multibyte characters didn’t behave correctly.

Changed

- The names of some variables have been updated to better reflect what they are.
- All function calls are now in their FQN form, slightly increasing performance.
- Tests are now properly ran against HHVM-3.30 and PHP nightly.

Deprecation

- deprecated `Assert::isTraversable()` in favor of `Assert::isIterable()`
 - This was already done in 1.3.0, but it was only done through a silenced `trigger_error`. It is now annotated as well.

1.4.0 (2018-12-25)

Added

- added `Assert::ip()`
- added `Assert::ipv4()`
- added `Assert::ipv6()`
- added `Assert::notRegex()`
- added `Assert::interfaceExists()`
- added `Assert::isList()`
- added `Assert::isMap()`
- added polyfill for `ctype`

Fixed

- Special case when comparing objects implementing `__toString()`

1.3.0 (2018-01-29)

Added

- added `Assert::minCount()`
- added `Assert::maxCount()`
- added `Assert::countBetween()`
- added `Assert::isCountable()`
- added `Assert::notWhitespaceOnly()`
- added `Assert::natural()`
- added `Assert::notContains()`
- added `Assert::isArrayAccessible()`
- added `Assert::isInstanceOfAny()`
- added `Assert::isIterable()`

Fixed

- `stringNotEmpty` will no longer report “0” is an empty string

Deprecation

- deprecated `Assert::isTraversable()` in favor of `Assert::isIterable()`

1.2.0 (2016-11-23)

- added `Assert::throws()`
- added `Assert::count()`
- added extension point `Assert::reportInvalidArgument()` for custom subclasses

1.1.0 (2016-08-09)

- added `Assert::object()`
- added `Assert::propertyExists()`
- added `Assert::propertyNotExists()`
- added `Assert::methodExists()`
- added `Assert::methodNotExists()`
- added `Assert::uuid()`

1.0.2 (2015-08-24)

- integrated Style CI
- add tests for minimum package dependencies on Travis CI

1.0.1 (2015-05-12)

- added support for PHP 5.3.3

1.0.0 (2015-05-12)

- first stable release

1.0.0-beta (2015-03-19)

- first beta release
