

AI Dev Tasks Constitution

Core Principles

I. Clarity and Specificity

All tasks and requirements **MUST** be clearly and specifically defined to ensure the AI agent has unambiguous instructions. Vague goals lead to unpredictable results.

II. Modularity

Complex problems **MUST** be broken down into smaller, self-contained, and independently verifiable tasks. This facilitates iterative development and simplifies debugging.

III. Iterative Development

Development **MUST** follow an iterative process. Implement one task, verify the result, and then proceed to the next. This ensures the agent stays on track and allows for course correction.

IV. Test-Driven Development (TDD)

For any code generation or modification, a corresponding test case **SHOULD** be defined first. The test validates the AI's output and serves as a living specification.

V. Human-in-the-Loop

The AI agent is a collaborator, not a replacement for the developer. The developer **MUST** review, approve, and guide the agent's work at each step of the process.

Development Workflow

The standard workflow for using this repository is as follows: 1. **Define:** Create a Product Requirement Document (PRD) using `create-prd.mdc`. 2. **Plan:** Generate a detailed task list from the PRD using `generate-tasks-from-prd.mdc`. 3. **Execute:** Process the task list step-by-step using `process-task-list.mdc`.

Governance

This Constitution is the foundational document for the AI Dev Tasks project. It governs the principles and workflows to ensure consistent, reliable, and high-quality AI-assisted development. Amendments to this constitution require a proposal and review process to maintain the integrity of the system.
